Garden Checklist

April

Lawns

Warm Season Grasses

Bermuda and Zosia – When the grass begins to green up, set the mower to cut at 1 ½ inch. If possible, dethatch the lawn to stimulate root growth. Fertilize the lawn with 5-5-15 just before the second pre-emergent application. Be weather aware, if too much nitrogen is used and an unexpected frost hits, it can damage the turf. Water lawns in the morning with 1 inch of water per week (unless raining) to prevent disease. Mow frequently enough so that no more than 1/3 of the grass blade is cut.

Take a soil test in March-April to determine the correct nutrients needed for your lawn.

Cool Season Grasses

Kentucky Bluegrass

April: Since this is a cold season grass, set the mower deck height to cut the grass at a height of 3-3.5 inches to prevent the grass from wilting/burning up. If mowed frequently, there is no need to remove grass clippings.

April-July: Apply a 15-5-10 weed and feed fertilizer to reduce broadleaf weeds while providing the correct balance of nutrients. Use 1 pound of nitrogen per 1000 square feet. Water lawns in the morning with 1 inch of water per week (unless raining) to prevent disease.

Take a soil test in March - April to determine the correct nutrients needed for your lawn.

Tall Fescue

March-May: Since this is a cold season grass, set the mower deck height to cut the grass at a height of 3 inches to prevent the grass from wilting/burning up. If mowed frequently, there is no need to remove grass clippings. No fertilization is needed in this time period. Water lawns in the morning with 1 inch of water per week (unless raining) to prevent disease. Apply pre-emergent herbicides as necessary to control weeds.

Take a soil test in March - April to determine the correct nutrients needed for your lawn.

Annuals

• Set out annual flowers after tax day. Fill the backs of sunny flowerbeds with tall annuals such as sunflowers, cosmos, or tithonia.

Perennials

• Fertilize perennial flowers now as growth is beginning. If you haven’t pruned perennials, do so now before the new growth makes it difficult.
• Plant summer bulbs such as daylilies, gladiolas, crinums, and gingrs.
• Avoid cutting foliage of narcissus (daffodils) or other spring bulbs until the tips have turned yellow or brown naturally. Foliage should easily pull off. If not, wait a little longer!

Fruits and Vegetables

• Resist planting warm season summer veggies until at least the last frost date of April 15th! The chance of a late frost is still high, and warm days can be deceiving.
• If you haven’t already done so, sow seeds indoors for eggplant, peppers, and tomatoes.
• Establish new plantings of fruit trees, grapes, strawberries, raspberries, asparagus, and rhubarb.
• Keep “hilling up” potatoes, mulch potatoes with 6 inches of straw.
• Wait until late April to warm season seeds, slips, and transplants.
• Plant sweet corn each week for a staggered summer harvest.

Miscellaneous

• Plan new landscaping projects on paper first. Be sure you know the mature size of each plant and light exposure to allow for growth and growing conditions.
• Add organic matter to soil to improve soil and drainage. You may do this by applying a top layer
• Mulch planting areas to minimize the need for weeding.
